

Do not put the AWS keys up on the git hub.

One of the Q/A stops is so they can do some phone testing. There are tests they have to run using physical phones as there isn't a software replication of this.

Use java for a few tests. And python.

Kick off into mavin test. Is a dev test we may not need to worry to much? Little confusing.

Most of their test are api calls. Dumping stuff on que's to see what happens. Selenium tests.

Async test process. The build agent would just sit there while a large test was running even though it didn't need to do anything for the test.

Reporting slack?

Ocestration - code or tool used to take code from a get hub, build it then send it out to a host server.

Use as many of AWS services as possible. They use the cloudformation template to set up their servers. Has a "Dry run feature"

Have open stack they spin up vm's on but they are pets don't worry about this.
